

Release Notes

Uinta™

Data Collection and Mapping Software 2.1.0 Windows & Android

These notes provide important information for Juniper Systems' release of Uinta 2.1.0 for Windows and Android.

Documentation and software updates are located on the Juniper Systems website:

<https://junipersys.com/support/uinta-training>

New Features and Enhancements

- **Import from GeoPackage.** Bring in feature and attribute layers as editable records and record types.
- **Export to GeoPackage.** More compatible with software like QGIS and ArcGIS Pro.
- **Nested relational queries.** Uinta's advanced filtering capabilities have been extended to allow users the ability to define nested filters on relationship fields. If a source record type has a many-to-one or many-to-many relationship field, then additional filters can be applied to the nested target record type that will filter the source records based on related attributes of the nested target record type.
- **User application preferences.**
 - Application units now accessible from *Settings > Preferences*.
 - Customize the placement and visibility of map view buttons (zoom in, zoom out, rotate).
- **Set the number of displayed records.** Determine how many records show simultaneously on the map view.

Fixes

- Includes bug fixes that have been addressed up to 2.0.0 beta.11
